GENERAL PLANTING DIRECTIONS FOR GROWING FLOWERS FROM SEED

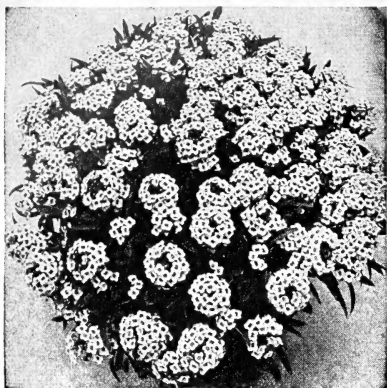

LOCATION: Nearly all flowers do well in sunny locations. Only a few can be grown in the shade. For flowers blooming in the late spring, high shade from the hot afternoon sun should be provided.

SOIL: Light, rich loamy soil is best suited for flowers. To improve heavy soils and conserve moisture, add peat moss and sand liberally. Spade the soil deeply and make the top 3 or 4 inches as fine and loose and smooth as possible. Well rotted manure worked into the soil before planting may be used if desired.

SOWING THE SEED: Fine seeds should be planted on the surface and a very little soil sprinkled over them, after which they should be pressed firmly to the soil with a board. Medium size seeds may be planted twice the depth of their diameter, or from $\frac{1}{4}$ to $\frac{1}{2}$ inch deep. Larger seeds, such as sweet peas, should go deeper.

WATERING: After planting, water with a fine spray to avoid washing the soil from the seed. Keep top soil damp—not wet—until germination. When large enough, thin plants from 2 to 12 inches, depending upon the variety. Water plants thoroughly **ONLY** at intervals—not daily. Watering depends upon the time of year, texture of soil and nature of plant.

FERTILIZER: We recommend the use of an all-purpose commercial fertilizer as a top dressing after the plants are up, to stimulate and properly feed the plants.

PLANTING THE FLOWER BORDER

PLANT A FLOWER BORDER

The flower border can be a very pleasing and colorful part of the home grounds—with small cost and little effort to keep it looking well. Most everyone has planted solid beds of one kind of flower, such as Zinnias, and the results have been generally very good. Other flowers blooming at the same time could be planted in the same bed, and the results would be equally good. The choice is up to you. In the sketch at the left, the dwarfier kinds are placed in the very front either in a continuous row or broken by bold bands of different kinds. Between the front planting and the rear which takes the most valuable space, the plants of many different kinds are placed in the middle, the taller, behind the smaller. Choose your favorites from the suggestions below and include some of the light, graceful flowers known as "fillers." They blend the colors of the bolder plants. In the sketch at the right, the plants in the group are *Gypsophila*, *Nigella*, *Cuscuta*, *Aurea*, *Lace* and *Shasta* *Daisies*.

HOW TO GROW SWEET PEAS

CULTURE: Sow seed in a location that receives morning and early afternoon sun. Seed may be planted from early fall to early spring. Dig a trench about a foot wide and deep and fill in with 6 inches of well-rotted manure. Mix a liberal amount of manure with the soil that has been removed and replace it. Flood bed thoroughly and allow to stand several days before planting seed. After the soil has settled sufficiently, open a trench in the bed about 6 inches deep and plant **ONE OUNCE** of seed to about 20 or 25 feet of row. During the warm weather cover seed about 2 or 3 inches deep and in cooler weather about 1 inch is sufficient. **CARE MUST BE TAKEN DURING WARM WEATHER NOT TO ROT THE SEED WITH TOO MUCH MOISTURE.** After planting seed soak the trench thoroughly and cover top with a light mulch of peat moss to prevent the surface soil from drying out and cracking. When the plants are up about 3 or 4 inches thin out to about 4 inches apart and begin drawing the earth to the plant to insure a deep root system. This makes a trench on each side of the plant along which the plant is watered. Provide a trellis or proper support as the vines attain great height. Frequent cultivation, water as needed after plants are up and occasional applications of Sweet Pea Food or a good all-purpose commercial fertilizer, will insure a profusion of lovely blooms. A long blooming season may be had by keeping the blossoms picked.

Liefgreen's Giant Spring Flowering Spencers

Plant in a sunny location for blooming during the spring months. Will bloom from four to six weeks later than the Early Spencers. Zinnias Are Arizona's Most Popular Summer Flower

ZINNIAS

The Zinnia is possibly more at home in the warmer sections of Arizona than any other flower. It is sun-loving, very easy to grow and a favorite in thousands of Arizona gardens. We wish to stress the fact that our Zinnias are absolutely the best strains in existence. The Zinnia is strictly a hot weather plant and should not be planted until March. Plantings may be continued throughout the summer.

CULTURE—Plant after all danger of frost is over. The seed should be planted about one-half inch deep and the seed bed covered with a mulch of our horticultural peat moss or grass to conserve the top moisture. Plant in rich soil in rows at least three feet apart and thin out plants so they are about 12 inches apart. Never plant Zinnias in the shade as they delight in the full sunshine. Keep the rows free and clean from Bermuda grass and weeds and cultivate and irrigate often. To avoid mildew dust the ground around the plants with dusting sulphur as soon as the buds appear. If you follow these instructions we know your efforts will be rewarded.

Liefgreen's Arizona Giant or Mammoth Zinnias

This strain is, in some ways, a companion type to the Dahlia Flowered. The plants are, however taller than the Dahlia Flowered type, reaching a height of 3 to 4 feet. The flowers are very large and well formed, with smooth topped, graceful appearance, the petals lying flat upon each other. The colors are very bright and clear and altogether it is one of the showiest of the large-flowered Zinnias.

BEET, EARLY WONDER

The best table and canning beet we offer. The slightly flattened dark red beets have small tap roots and excellent flavor. Young tops may be used as greens.

All of our planting instructions are for the Salt River Valley and similar climates. See page 37 for planting dates if you live at higher altitudes in Arizona.

The sketch below shows a few helpful hints on seed planting. First of all in importance is a carefully prepared seed bed—deeply dug, finely broken up and raked smooth to receive the seed. Enrich the soil with peat, manure or other humus material at the time of spading.

If your soil has a tendency to crust over or "bake" after watering, we suggest applying a mulch of finely pulverized manure, peat or grass clippings. This will keep the water content of the soil more uniform and assist germination.

ONION, SWEET SPANISH

A popular sweet onion for home and market gardens.

For the beds, make furrows from 2 to 3 feet apart. Run water from a hose or ditch, all the way through the beds. This will enable the gardener to determine high and low spots according to the water level, and accomplish a complete leveling.

PLANTING TIPS FOR THE HOME VEGETABLE GARDEN

1. Spading Soil.
2. Raking Level.
3. Making Seed Bed.
4. Sowing Seed.

Take a pinch of seed between thumb and fingers. Rubbing thumb across fingers releases seed.

Properly prepared soil is loosened and turned over full depth of spading fork.

Trench made with hoe for watering seed bed.

Rake seed bed smooth.

Sow Seed Here

Method of making seed bed.

2-3 ft

Sow seed thinly to avoid waste. Cover lightly to the proper depth.

Plant a Victory Vegetable Garden – Help Win the War!

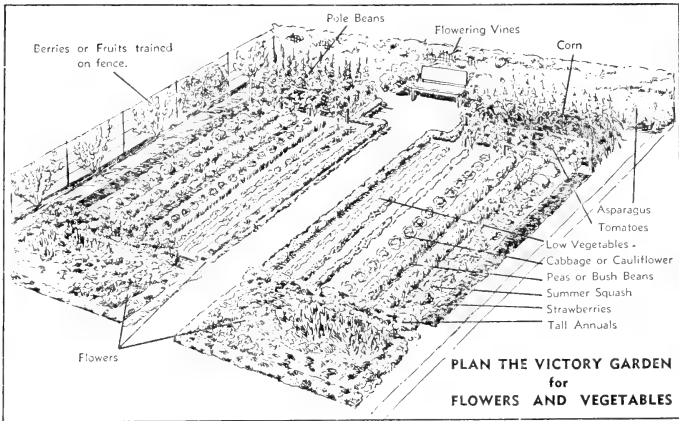

The ever dwindling supply of farm labor and increased freight loads of our railroads and other factors, with which we are all familiar, is changing the buying habits of everyone. Those of us who are fortunate to be garden minded can grow vegetables at home equal in quality to those available before the war and better than the average available today. We need not replant our gardens unless by so doing we achieve a better garden than we had before. The use of flowers with vegetables as we suggest here will give great satisfaction. You will have flowers, as before, and at the same time will be relieving the growers of much responsibility in meeting their ever increasing demands for produce. Grow all the vegetables you can and preserve the surplus.

Making a Victory garden is not as complicated as it may seem. With a good plan to work from, it is possible on a small area to produce an amazing quantity of vegetables and flowers. Very much depends on the area of ground available but the average city backyard, which is probably the most restricted in size, will produce many green vegetables, a number of root vegetables, and if vines are trained on the fences—all the cucumbers and beans you will need. Pumpkins and squash can still be grown among the corn to save space.

Flowers can be planted to be seen from the house, in just the right amount for color and accent to make the garden cheerful. Select old favorites and a few novelties for pleasant variety. In this way your Victory garden will serve a real need. You will be well repaid in vegetables to eat and flowers for the house.

Plan for all year growing. What you plant this fall must not interfere with spring planting for summer crops. Short season crops will be used quickly and should be replanted as long as the season permits. In this way one row will produce the equivalent of several, but fertilizing is necessary to replace the nutrient extracted by the previous crop.

This planting guide is filled with essential information gained from years of experience in this climate. We offer these suggestions so your garden will give better crops of flowers and vegetables. But, all these may not secure success if common sense in the location of the garden, its planting, preparation of soil and care of the plants is not followed. Even more important is the use of **good seed**. Liefgreen's reputation has been built on supplying the finest seed of the best varieties for Arizona growing conditions. You can depend on seeds from us.

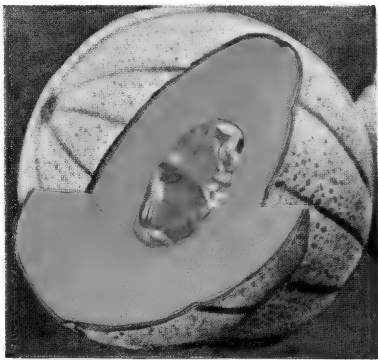

A good working plan saves time and effort. This plan gives ample space for flowers and vegetables. Crops can be rotated without re-making the garden.

RADISH, EARLY SCARLET TURNIP

Radishes are about the easiest vegetable to grow. Sow any time of the year except the hottest months and have a continuous supply of fresh, crisp radishes for the table.

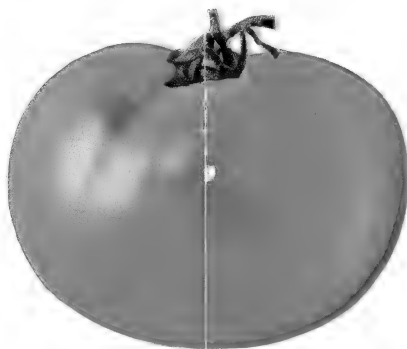

CANTALOUPE, HALE'S BEST NO. 45

An early ripening, mildew resistant melon for the home and market gardener. Deep salmon thick flesh of finest flavor. Melons are oval, heavily netted and faintly striped.

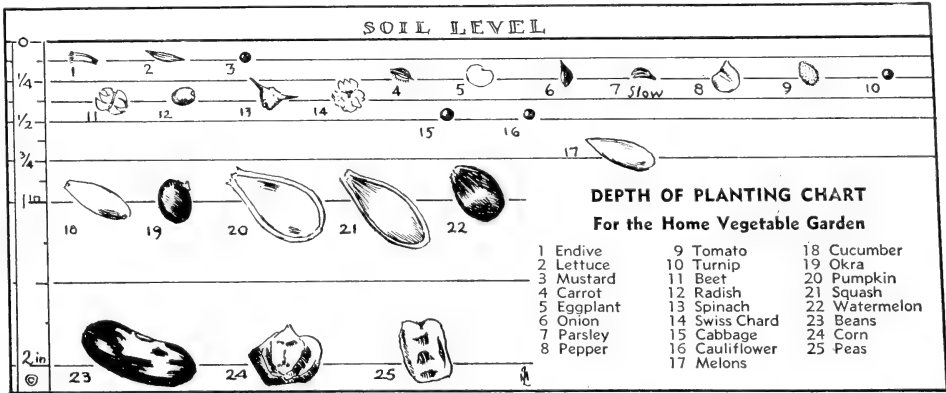

The home gardener grows his plants under widely different conditions from those experienced by the commercial market gardener. Vegetable gardening here is little more than a variation of flower gardening. Seeds can be given better care in watering, weeding and later in cultivation and picking the crop is a small scale operation.

The sketch below shows the proper depth of planting we recommend for vegetable gardeners to cover their seed. It is best not to follow the depths recommended for field grown crops, which would be too deep for the home garden.

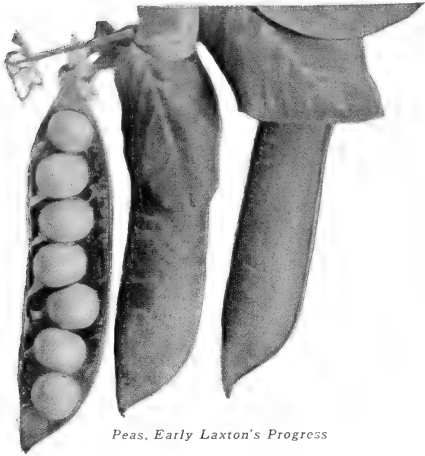

Many vegetable seeds are scarce and although there is enough to go around we should not waste seed. Sow thinly and evenly, paying attention to the depth of covering recommended.

Three pounds of seed is required to the acre for dry onions or 1 ounce to 100 feet. For green onions or bunching onions plant 10 pounds per acre. Our onion seed is of the highest type as to germination and purity. Consult with us as to what and how to plant and allow us to quote you quantity prices.

Berry Plants and Vegetables for the Victory Garden

STRAWBERRIES

Strawberry Culture

In the warmer sections of Arizona strawberries are usually planted on raised beds similar to lettuce beds. Alternate plants on each side of the bed about 12 inches apart. Water immediately after planting. Irrigating during the winter depends entirely on weather conditions. During the summer months plants must be watered not less than every three days. Under no conditions should plants be cultivated during the summer months as the plants are very shallow rooted. Allow weeds to grow around the plant during the summer months to provide shade. In the fall months the plants may be cultivated and fertilized. Also fertilize during the bearing season. Strawberries may be planted from the fall months on through to late spring.

IMPROVED KLONDIKE—This variety does well in hot sections. It is a vigorous grower, very prolific and yields over a long period. A medium size berry of good flavor and is an excellent shipper. Dozen 35c, per 100 plants, \$2.00, postpaid.

The second year of our participation in the war is well upon us and with it we will see a curtailment in growing certain vegetable crops. Many vegetables, once considered essential to all of us, will be restricted for the duration. This affects market gardeners whose burden of supplying essential vegetables is greater today than ever before. Every family with ground that can be planted should have a Victory garden in which he can grow many types of vegetables—those that are not restricted to help relieve the growers and transportation facilities and those that are restricted to make his meals at home more delicious and complete.
